

Agro Business Solutions

Software for your flower company

ABS Fresh

ABS Fresh : Control for flower producing companies

ABS Fresh provides a radical change in the way your flower production, processing and sales are managed and your business is planned. The exchange and sharing of information within one system will become the key driver of your business

With ABS Fresh your production specialists will work more efficiently and are able to book the results more quickly. The processing department will have a controlled working environment while sales department will have a constant overview on today's available stock as well as your future stock for planned transactions.

ABS Fresh includes a standard set of documents such as work lists, pick and packing lists, labels and other standard documents. With the standard reports you will be able to analyze the performance of your business.

ABS Fresh will enhance your Production Process

Default settings in ABS Fresh will maintain your specific rose production behaviour per variety. The system will make predictions on the production in the greenhouses based on growth cycle of the variety, stem length deviation, local growth conditions and weather influences.

Long term estimates will provide overviews of the production forecasts from the greenhouses. The system is able to display the match between production and future sales in order to have a higher fit probability. This helps the long term production forecast to be matched with long term sales contracts with automatic reservations and contract related process activities after harvest.

Mid term estimates will provide you with an even better view on the production results over the last 4 weeks prior to harvest. Your counting routines in this period will then more accurately estimate short term harvest planning. You will receive a comparison with the long term growth planning to analyse your production process.

Short term estimates will help you to better support your short term sales and your long term contract fulfilment. Ultimately you can better prepare your shipments as well as understand any transport mismatches at an early stage.

Your weather stations can be integrated with ABS Fresh. Impact of weather conditions like temperature, time of daylight or intensity and humidity will influence your future production results. The system communicates with weather stations in order to change the growth cycle of the varieties.

Event registration in the field will provide an early warning on future production. For example irregularities like diseases or spraying damage can be registered as these will influence your production output. Also water use, fertilisation, phyto treatments etcetera can be registered for MPS tracking and tracing purposes. Your MPS logbook can be produced in a minute.

ABS Fresh will structure your Processing

Receipt procedures in the first cooler will help you to keep track on the origin of your harvest based on date, variety, farm and greenhouse.

Work instructions for bunching will come from the system per contract or per customer and in logic sequence. Also standard packing for auction sales and spot orders.

Matching your contract orders to your new stock is automatically suggested by the system. Any specific contractual requirements are automatically included in the processing instructions.

Stock positions are visible much earlier for assigning stock to contracts, to shipments in general but also short term sales requirements and spot order sales.

Free stock is been made available for short term orders and spot orders with a smart stock overview screen. The Sales create the Sales Order by clicking on the available stock to customer orders with all relevant documents for packing, shipment and invoicing.

Workers output registration can be measured and analysed with the use of reports. Any estimate provided earlier can be presented against the actual results to find any mismatch.

NON-flower stock management, will control stock of eg. rubber bands, boxes, boxes, chemicals, fertilizers etc., is available to use and will be related to usage during production and processing. So stock planning follows production forecast.

Documents are standard available in the system such as order confirmations, pro forma invoices, invoices, pick lists, packing lists, stickers, barcodes and and many other standard documents.

Logistics planning is available for your selection of airlines, delivery slots management and delivery planning.

ABS Fresh will support your Sales

Sales to Auctions and Spot Orders will support the distribution through different sales channels, with delivery, repacking activities and redistribution of your stock over several Auctions as well as Spot Orders customers.

Sales track & trace will follow up on any question from your customers by your Sales department in a quick and logical flow, even reacting on number recognition via your telephone system.

Reports

Management reports for analysis are standard available in reporting levels and based on user rights. Real time and high quality information not influenced by reports from many other sources, and are available in many versions. Turnover reports (per customer/per variety), stock position, cost reporting and many more reports are possible.

ABS Fresh is professional

Multi crop: From seeds to plant material (rose stentlings), all kinds of flower and vegetable production.

Multi site: Manages different sites in one data base. Separated or (partly) integrated. Fit for internationally operating companies with subsidiaries in foreign countries..

Internet: The system can be connected to web-shops. Virtual stock can be made available for web-sales. Create your virtual marketing platform.

Financial: ABS Fresh registers costs and invoices. Presented at ledger level and communicating seamlessly with your current bookkeeping software.
